

Problem Scope

Create a backend API that manages a merchant account.

Requirements

1. CRUD for merchant accounts.

Merchant code should be unique

2. CRUD for a team member on a merchant account.

Team members should have unique email addresses

3. Get the list of team members per merchant

4. Get list should implement pagination

Must have

- An API that handles all requests, written in Go.
- Req/Resp in JSON format
- Use a DB (any choice) with defined models.
- Testing
- Code should be committed in Github repo that the team can review.
- The app can be run locally and any platform/environment
- write a technical document for frontend user how to use the API (requests/response)
- good architecture design - the app ideally should be designed and implement in good architecture for future changes

Good to have

Authentication

Time to complete

5 days (can be submitted earlier)
